- Please inform the National Blood service if you donate blood as you may not be eligible to give blood for at least six months after application of permanent cosmetics.
- Please phone us if you have any concern or questions at all. We are happy to answer even the smallest question or concern you may have.

COMMON SYMPTOMS EXPERIENCED DURING HEALING

- Minor redness, bruising, swelling and tenderness are symptoms to be expected immediately after treatment.
- Dry flaking and mild itching as the treated area heals could be experienced.
- Crusting may be experienced
-

These symptoms are a normal part of the healing process. The length of time the above symptoms take to settle varies from one person to another.

Proper care of your Cosmetic enhancement & Medical Tattoo investment is vital. Follow the general instructions then the steps for the particular procedure you have received.

AFTER CARE INSTRUCTIONS FOR COSMETIC ENHANCEMENT TATTOOING PROCEDURES

FOLLOW-UP PROCEDURES FOR EYE-LINING & EYEBROWS

THE FOLLOW-UP APPOINTMENT IS AN ESSENTIAL STEP IN THE WHOLE COSMETIC TATTOO PROCEDURE. SOME UNEVENNESS OF COLOUR CAN BE EXPERIENCED AFTER HEALING IS COMPLETED AND OF COURSE UP TO 70% LOSS OF COLOUR. THIS CAN BE CORRECTED AT THE FOLLOW-UP VISIT. ANY ADDITIONAL ADD-ON REQUIRED OR COLOUR CHANGE NEEDED CAN BE ACHIEVED AT THE FOLLOW-UP APPOINTMENT.

All PMU Procedures will initially require two visits.

HYGIENE INSTRUCTIONS TO PREVENT CROSS CONTAMINATION

- Wash your hands before applying your healing product
- Use a cotton bud to apply the healing product. Do not return the cotton bud back into the healing product once it has been in contact with the injured skin. Use a clean bud each time you apply the product.
- Do not use facial cleanser on the treated area until it has healed.
- Do not PICK, PEEL OR RUB any dry flaking skin or crusting of the treated area as this could encourage the risk of infection or scarring of the skin. Allow the skin to heal in its own time with the assistance of the healing product.

GENERAL CARE AFTER COSMETIC ENHANCEMENT TATOO PROCEDURE

The average healing time for most skins can arrange from 5 to 14 days.

- Do not expose treated skin to sunlight, tanning treatments, Jacuzzis, saunas, salt water, chlorinated pools, direct shower spray.
- Do not receive bleaching treatments, waxing treatments, electrolysis or laser hair removal treatments close to the treated area.
- Do not ever use Retin-A, Vitamin C or products containing Alpha Hydroxy Acids on the treated area as these products could fade the pigment colour.
- Do not use antibiotics on pigmented skin. Antibiotics cause a severe allergic-like reaction.

EYE-LINING

- Rinse your eyes after treatment with cold water as often deemed necessary.
- Instead of rinsing you may place wet cotton-pads in the refrigerator for 10 to 15minutes and place on the eyelids to reduce swelling.
- Do not put pads in the freezer as they burn the tender skin around the eyes.
- Use eye drops as often as you wish after treatment to soothe the eye area.
- Please follow Hygiene and General instructions.
- Do not receive eyelash tinting, permanent curling or artificial eyelash application for the next two weeks after treatment.
- Wear sunglasses to protect your eyes.
- Do not wear contact lenses for 24 – 48 hrs after treatment.
- Do not apply eye makeup for up to 72 hrs.

EYEBROWS

- For the first 24 hours after the treatment, wipe the brows with the wet cotton wool pads to remove body fluids as they appear.
- Use a clean pad for each brow to prevent cross contamination.
- Pat the area dry with a clean tissue then apply the healing product Cosmique Ink with a cotton bud. Ensure you use a clean cotton bud on each brow.
- Re apply healing product 2-3 times daily during healing process.
- Towards the end of the healing process apply only once or twice per day.
- Please follow Hygiene and General Care Instructions.

PIGMENT FADING DEPENDS ON THE FOLLOWING

- The skin's ability to accept pigment. Total rejection of pigment can occur. This cannot be determined before procedure.
- The general health of the skin.
- The degree of crust formation and flaking experienced during the healing process.
- The intensity of the choice of pigment colour
- The treated area will appear very exact and darker in colour when first treated but approximately 40 to 70% of the intensity will be lost during the healing process. The pigment colour loss for the lip-liner and full lip procedure could be up to 80%. The colour will soften during healing. Some skins lose quite a lot of pigment during healing and some hardly lose any colour at all.
- The skin care products used. Those products that have high percentage Vitamin A and C may cause the pigment to fade more quickly. Also Alpha Hydroxy Acids have the same effect.
- Some medications can cause more rapid than normal fading of pigment.
- The sun will fade the pigment and so will swimming in salt and chlorinated water.
- Too much time lapse between the original treatment and the follow up treatment.
